

Orbit News Network (ONN)

SUMMARY

Orbit News Network (ONN) is not a news website. It is the News Intelligence Platform that powers every current and future Orbit Systems AI application. ONN is a headless, API-first platform responsible for collecting, enriching, validating, distributing, and analyzing both external news and first-party content throughout the Orbit ecosystem.

MISSION

Every OSai application consumes ONN. Most users will never visit ONN directly.

VISION

Create the world's most intelligent news and content infrastructure. ONN should become for news intelligence what Stripe became for payments and Vercel became for deployments. Applications should be able to publish once and receive intelligently enriched, AI-enhanced, targeted content everywhere.

PRODUCT PHILOSOPHY

Never think of ONN as a news reader. Always think of ONN as infrastructure. ONN should feel like: Vercel; Stripe Dashboard; Neon; Cloudflare; Datadog; GitHub; Grafana. Everything should feel modern, data-rich, elegant, and developer-first.

CORE RESPONSIBILITIES

1) News Collection: RSS, licensed APIs, government sources, SEC filings, company press releases, blogs, partner feeds, social signals, future premium providers. 2) Intelligence Processing: Normalization, Deduplication, Entity Extraction, Topic Classification, Relationship Detection, Fact Verification, AI Summarization, Sentiment Analysis, Risk Detection, Forecast Signals, Confidence Scoring, Historical Context, Embedding Generation, Knowledge Graph Linking. 3) Publishing Platform: receives original content from Orbit applications (Career Pivot, Social Encounter, Advanced Predictive Data, Future CRM, Future Healthcare, Future Government). Applications authenticate with ONN; users remain authenticated in originating application; ONN acts as a headless publishing engine. 4) Distribution: publish once, distribute everywhere; determines eligible destinations, relevance, permissions, format, timing, language, priority. 5) Intelligence API: REST, GraphQL (future), Webhooks, SDKs, Streaming, Embeddings, Search, Entity APIs, Relationship APIs, Analytics APIs. 6) Analytics: content performance, API usage, distribution, engagement, customer activity, system health, publisher quality, knowledge graph growth.

IDENTITY MODEL

Users never create ONN accounts. Identity flows from Orbit applications: Application -> Publication -> Contributor. Example: Career Pivot -> Career Pivot Community -> Jane Smith. The application owns authentication. ONN stores a federated identity.

PUBLISHING WORKFLOW

Draft -> Application Review -> ONN Submission -> AI Moderation -> Content Enrichment -> Editorial Rules -> Distribution -> Analytics -> Continuous Learning.

DISTRIBUTION LEVELS

Private, Profile, Application, Network, Partner, Public. Applications decide what levels users may access.

CORE PLATFORM MODULES

Administration: Overview, Stories, Feeds, Topics, Entities, Relationships, Customers, Publications, Distribution, Moderation, System Health, API Management, Analytics, Billing, Settings. Subscriber Portal: Overview, Projects, Feeds, Content Studio, Publications, Distribution, API Keys, Knowledge Graph, Analytics, Alerts, Integrations, Documentation, Settings. Developer Portal: Quick Start, SDKs, API Explorer, Playground, Schemas, Webhooks, Rate Limits, Examples, OpenAPI, Request Logs.

CONTENT STUDIO

Applications submit content through ONN APIs. Supported content: Articles, Press Releases, Research, Videos, Podcasts, Announcements, Events, Insights, Executive Briefings, Product Updates, Alerts. Every submission includes title, body, author, topics, entities, citations, publication, permissions, distribution preferences.

KNOWLEDGE GRAPH

Every story connects to People, Companies, Organizations, Countries, Industries, Products, Technologies, Markets, Events, Policies. Everything is searchable. Everything is linked.

AI SERVICES

ONN automatically produces Summaries, Executive Briefings, SEO Metadata, Social Posts, Embeddings, Keywords, Tags, Related Stories, Timeline, Historical Context, Forecast Signals, Entity Relationships, Industry Relevance, Risk Indicators.

ARCHITECTURE

External Sources + Orbit Applications -> Collection -> Normalization -> Deduplication -> AI Processing -> Knowledge Graph -> Distribution Engine -> API Layer -> Orbit Applications -> Partner Applications -> Analytics.

DESIGN PHILOSOPHY

Design language should resemble Vercel, Stripe, Linear, GitHub, Cloudflare, Neon. Minimal, Professional, Developer-first. No unnecessary decoration. Data should be the visual focus.

COLOR PALETTE

Background #071018; Surface #102033; Primary #00AEEF; Secondary #4A90E2; Accent #38BDF8; Success #00C853; Warning #FFC107; Danger #FF5252; Text #F5F8FC; Muted #90A4B8; Border #23384F.

TYPOGRAPHY

Primary: Inter. Display: Space Grotesk. Monospace: JetBrains Mono.

MOTION

Subtle. Professional. Use animation only to communicate processing, status, deployment, relationships, live updates. Avoid decorative animation.

DESIGN SYSTEM

Reusable components: Buttons, Cards, Tables, Graphs, Node Graphs, Charts, Metrics, Pipelines, Forms, Dialogs, Notifications, Activity Timelines, Command Palette. Everything should be reusable.

DASHBOARDS

Every dashboard should answer: What is happening? What changed? What requires attention? What should happen next?

SUBSCRIBER EXPERIENCE

Subscribers manage projects. Projects own API Keys, Feeds, Publications, Distribution Rules, Analytics, Knowledge Graph Views, Integrations. One organization can have many projects.

API PHILOSOPHY

Everything ONN does must be accessible through APIs. Every UI action should have a corresponding API endpoint. The UI is a client of the platform—not the platform itself.

CAREER PIVOT INTEGRATION

Career Pivot users never authenticate to ONN. Career Pivot sends content directly to ONN. ONN enriches content. ONN distributes content. ONN returns analytics. Career Pivot displays ONN status inside Career Pivot. The user never leaves Career Pivot. This same architecture should work for every Orbit application.

DEVELOPMENT PRINCIPLES

Always build reusable components. Avoid application-specific logic. Everything should support multiple Orbit applications. Prefer configuration over hardcoded behavior. Design APIs before interfaces. Think platform-first. Every feature should be extensible. Every service should be observable. Every interaction should be measurable.

LONG-TERM VISION

Orbit News Network is the intelligence backbone of the Orbit ecosystem. Capabilities: Real-time news intelligence, Enterprise publishing, Knowledge graph management, Content syndication, Forecast generation, Executive briefing creation, Risk monitoring, Entity tracking, API distribution, Developer integrations, Cross-application intelligence, AI-assisted publishing, Content adaptation, Analytics, Workflow automation. Future Orbit products should not build their own news systems; they should consume ONN.

GUIDING PRINCIPLE

Users create content where they work. Applications publish through ONN. ONN enriches, distributes, and measures intelligence across the entire Orbit ecosystem.

SUCCESS CRITERIA

Every architectural decision should move ONN toward becoming the central intelligence layer for Orbit Systems AI. If a proposed feature only benefits one application, redesign it so it benefits the platform. Build ONN as infrastructure first. Everything else is a client.
